

ABSTRACT

The present invention is directed towards a contact retention system having a outer contact body, a front spacer, contacts, a rear spacer and a cable ferrule. The rear spacer holds the contacts in position during assembly and use of
5 the cable. The rear spacer is a generally cylindrical-shaped structure having U-shaped slots equally spaced around its circumference, each slot holding and positioning a single contact for insertion into the front spacer. The rear spacer is made of a dielectric material and insulates each conductor from the other conductors.
